WASTELAND PANTRY

Lean Canvas: food waste prediction for campus and community kitchens

High-level concept: a weather forecast for your kitchen's food waste.

1 PROBLEM

- Kitchens cook by guesswork. Attendance swings with events, exams, holidays and weather.
- Over-cooked food means wasted money, ingredients and effort.
- Waste is usually written down after it happens, so nothing guides the next meal.

Existing alternatives: paper logbooks, spreadsheets and the manager's gut feeling.

4 SOLUTION

- Waste forecast in kg for each planned meal, using menu, attendance, event and weather.
- Insights on which meals, menus and events waste the most.
- Simple planner screen: enter tomorrow's plan, see the predicted waste.

8 KEY METRICS

- Forecast error (MAE, kg) on real kitchen data
- Waste cut vs the kitchen's own baseline
- Active kitchens and weekly forecasts used
- Renewals each academic year

3 UNIQUE VALUE PROPOSITION

Know how much food will be wasted before you cook it, and cook just enough.

Saves food cost, cuts waste, and supports UN SDG 12: Responsible Consumption and Production.

5 UNFAIR ADVANTAGE

- Each kitchen's own history trains its model, so it improves with use.
- Built around campus patterns: festivals, exams, mess timings.
- Simple, explainable models managers can trust.

9 CHANNELS

- Direct pilots with campus admin and mess committees
- SDG 12 and sustainability events, college fests
- Web app, nothing to install
- Word of mouth, LinkedIn and a public GitHub demo

2 CUSTOMER SEGMENTS

- College canteens and hostel messes
- Corporate and office cafeterias
- Community kitchens and NGOs

Early adopters: hostel mess committees and campuses that already keep daily meal records.

7 COST STRUCTURE

- Cloud hosting for the model and web app
- Founder development time
- Onboarding each kitchen: data cleanup and setup
- Pilot outreach and travel
- Support and maintenance

6 REVENUE STREAMS

- Monthly subscription per kitchen: [YOUR PRICE, set after pilots]
- Free pilot for first campuses, paid once savings are shown
- Annual licence for campuses with many messes
- Waste reports for SDG 12 sustainability reporting (add-on)

Lifetime value: kitchens renew every academic year if waste and food cost fall.

Status: working prototype trained on 1,800 synthetic meal records. Real-world savings need pilot data from actual kitchens.
